

BATTERY PROTECTION IC FOR 4-SERIES OR 5-SERIES CELL PACK

www.sii-ic.com

© Seiko Instruments Inc., 2010-2012

Rev.1.4_00

The S-8205A/B Series includes a voltage detection circuit with high accuracy and a delay circuit, in single use, makes it possible for users to monitor the status of 4-series or 5-series cell lithium-ion rechargeable battery.

The S-8205A/B Series is suitable for protecting rechargeable lithium-ion battery pack from overcharge, overdischarge, and overcurrent.

■ Features

- High-accuracy voltage detection for each cell

Overcharge detection voltage n (n = 1 to 5)	3.55 V to 4.40 V ^{*1} (50 mV step)	Accuracy ±25 mV
Overcharge release voltage n (n = 1 to 5)	3.30 V to 4.40 V ^{*2}	Accuracy ±50 mV
Overdischarge detection voltage n (n = 1 to 5)	2.0 V to 3.2 V ^{*1} (100 mV step)	Accuracy ±80 mV
Overdischarge release voltage n (n = 1 to 5)	2.0 V to 3.4 V ^{*3}	Accuracy ±100 mV
- Discharge overcurrent detection in 2-step

Discharge overcurrent detection voltage	0.05 V to 0.30 V ^{*4} (50 mV step)	Accuracy ±15 mV
Short circuit detection voltage	0.50 V to 1.0 V ^{*4} (100 mV step)	Accuracy ±100 mV
- Charge overcurrent detection

Charge overcurrent detection voltage	–0.30 V to –0.05 V (50 mV step)	Accuracy ±30 mV
--------------------------------------	---------------------------------	-----------------
- Settable by external capacitor; Overcharge detection delay time, Overdischarge detection delay time, Discharge overcurrent detection delay time, Charge overcurrent detection delay time
(Load short circuit detection delay time is internally fixed.)
- S-8205A Series: used for 4-series cell, S-8205B Series: used for 5-series cell
- Independent charging and discharge control by the control pins
- Products with and without a power-down function can be selected.
- Withstand voltage element

	Absolute maximum rating : 28 V
--	--------------------------------
- Wide range of operation voltage

	2 V to 24 V
--	-------------
- Wide range of operation temperature

	Ta = –40°C to +85°C
--	---------------------
- Low current consumption

Operation mode	40 µA max. (Ta = +25°C)
Power-down mode	0.1 µA max. (Ta = +25°C)
- Lead-free (Sn 100%), halogen-free^{*5}

*1. The overcharge detection voltage n (n = 1 to 5) and overdischarge detection voltage (n = 1 to 5) are not selectable if the voltage difference between them is 0.6 V or less.

*2. Overcharge hysteresis voltage n (n = 1 to 5) is selectable in 0 V, or in 0.1 V to 0.4 V in 50 mV step.
(Overcharge hysteresis voltage = Overcharge detection voltage – Overcharge release voltage)

*3. Overdischarge hysteresis voltage n (n = 1 to 5) is selectable in 0 V, or in 0.2 V to 0.7 V in 100 mV step.
(Overdischarge hysteresis voltage = Overdischarge release voltage – Overdischarge detection voltage)

*4. The discharge overcurrent detection voltage and load short circuit detection voltage are not selectable if the voltage difference between them is 0.3 V or less.

*5. Refer to "■ Product Name Structure" for details.

■ Application

- Rechargeable lithium-ion battery pack

■ Package

- 16-Pin TSSOP

■ Block Diagram

1. S-8205A Series

Remark Diodes in the figure are parasitic diodes.

Figure 1

Seiko Instruments Inc.

2. S-8205B Series

Remark Diodes in the figure are parasitic diodes.

Figure 2

■ Product Name Structure

1. Product Name

*1. Refer to tape specifications.

*2. Refer to "3. Product Name List".

2. Package

Table 1 Package Drawing Code

Package Name	Dimension	Tape	Reel
16-Pin TSSOP	FT016-A-P-SD	FT016-A-C-SD	FT016-A-R-S1

BATTERY PROTECTION IC FOR 4-SERIES OR 5-SERIES CELL PACK

Rev.1.4_00

S-8205A/B Series

3. Product Name List

Table 2 S-8205A Series (For 4-Series Cell)

Product Name	Overcharge Detection Voltage [V _{CU}]	Overcharge Release Voltage [V _{CL}]	Overdischarge Detection Voltage [V _{DL}]	Overdischarge Release Voltage [V _{DU}]	Discharge Overcurrent Detection Voltage [V _{DIOV}]	Load Short Circuit Detection Voltage [V _{SHORT}]	Charge Overcurrent Detection Voltage [V _{CIOV}]	0 V Battery Charge Function	Power Down Function	Delay Time*1
S-8205AAA-TCT1U	4.225 V	4.125 V	2.30 V	3.00 V	0.15 V	0.50 V	-0.10 V	Available	Yes	(1)
S-8205AAB-TCT1U	4.225 V	4.075 V	2.30 V	3.00 V	0.20 V	0.50 V	-0.10 V	Available	Yes	(1)

*1. The delay time is set by the external capacitor.

But the discharge overcurrent release delay time (t_{DIOVR}) and charge overcurrent release delay time (t_{CIOVR}) are calculated by discharge overcurrent detection delay time (t_{DIOV}) and charge overcurrent detection delay time (t_{CIOV}) as the following equations. 1 [ms] (typ.) is the internal delay time of the S-8205A Series.

$$(1) t_{DIOVR} = t_{DIOV} \times 10 + 1 \text{ [ms] (typ.)}, t_{CIOVR} = t_{CIOV} \times 10 + 1 \text{ [ms] (typ.)}$$

$$(2) t_{DIOVR} = t_{DIOV} \times 0.05 + 1 \text{ [ms] (typ.)}, t_{CIOVR} = t_{CIOV} \times 0.05 + 1 \text{ [ms] (typ.)}$$

Moreover, refer to "8. Delay Time Setting" in "■ Operation" for calculational methods of delay times.

Remark Please contact our sales office for products with detection voltage values other than those specified above.

■ Pin Configuration

Figure 3

Table 4

Pin No.	Symbol	Description
1	VM	Pin for voltage detection between VSS and VM
2	CO	FET gate connection pin for charge control (Pch open drain output) Pin for voltage detection between VSS and CO
3	DO	FET gate connection pin for discharge control FET (CMOS output)
4	VINI	Pin for voltage detection between VSS and VINI
5	CTLC	Control pin for charge FET
6	CTLD	Control pin for discharge FET
7	CCT	Capacitor connection pin for delay for overcharge detection voltage
8	CDT	Capacitor connection pin for delay for overdischarge detection voltage
9	CIT	Capacitor connection pin for delay for discharge overcurrent detection, charge overcurrent detection
10	VSS	Input pin for negative power supply, Connection pin for battery 5's negative voltage
11	VC5	Connection pin for battery 4's negative voltage, Connection pin for battery 5's positive voltage
12	VC4	Connection pin for battery 3's negative voltage, Connection pin for battery 4's positive voltage
13	VC3	Connection pin for battery 2's negative voltage, Connection pin for battery 3's positive voltage
14	VC2	Connection pin for battery 1's negative voltage, Connection pin for battery 2's positive voltage
15	VC1	Connection pin for battery 1's positive voltage
16	VDD	Input pin for positive power supply, Connection pin for battery 1's positive voltage

■ Absolute Maximum Ratings

Table 5

(Ta = +25°C unless otherwise specified)

Item	Symbol	Applied Pin	Absolute Maximum Rating	Unit
Input voltage between VDD and VSS	V _{DS}	VDD	V _{SS} – 0.3 to V _{SS} + 28	V
Input pin voltage 1	V _{IN1}	VC1, VC2, VC3, VC4, VC5, CTLC, CTLD, CCT, CDT, CIT	V _{SS} – 0.3 to V _{DD} + 0.3	V
Input pin voltage 2	V _{IN2}	VM, VINI	V _{DD} – 28 to V _{DD} + 0.3	V
DO pin output voltage	V _{DO}	DO	V _{SS} – 0.3 to V _{DD} + 0.3	V
CO pin input and output voltage	V _{CO}	CO	V _{DD} – 28 to V _{DD} + 0.3	V
Power dissipation	P _D	–	1100 ^{*1}	mW
Operating ambient temperature	T _{opr}	–	–40 to +85	°C
Storage temperature	T _{stg}	–	–40 to +125	°C

*1. When mounted on board

[Mounted board]

(1) Board size: 114.3 mm × 76.2 mm × t1.6 mm

(2) Board name: JEDEC STANDARD51-7

Caution The absolute maximum ratings are rated values exceeding which the product could suffer physical damage. These values must therefore not be exceeded under any conditions.

Figure 4 Power Dissipation of Package (When Mounted on Board)

- *1. Because S-8205A Series are the protection ICs for 4-series cell, there is no V5 for them.
- *2. Voltage temperature coefficient 1: Overcharge detection voltage
- *3. Voltage temperature coefficient 2: Discharge overcurrent detection voltage
- *4. Since products are not screened at high and low temperature, the specification for this temperature range is guaranteed by design, not tested in production.
- *5. Refer to "■ Operation" for details of delay time function.
- *6. For products with power-down function
- *7. The S-8205A/B Series does not operate detection if the operating voltage between VDD and VSS (V_{DSOP}) is CTLC change voltage (V_{CTLC}) or CTLD change voltage (V_{CTLD}) or less.

■ Test Circuit

1. Current Consumption during Operation and Power down (Test Circuit 1)

Set S1 and S2 to OFF.

1. 1 Current Consumption during Operation (I_{OPE})

Set $V_1 = V_2 = V_3 = V_4 = 3.5$ V (S-8205A Series), $V_1 = V_2 = V_3 = V_4 = V_5 = 3.5$ V (S-8205B Series), S2 to ON.
 I_{SS} is the current consumption during operation (I_{OPE}) at that time.

1. 2 Current Consumption during Power down (I_{PDN}) (For products with power-down function)

Set $V_1 = V_2 = V_3 = V_4 = 1.5$ V (S-8205A Series), $V_1 = V_2 = V_3 = V_4 = V_5 = 1.5$ V (S-8205B Series), S1 to ON.
 I_{SS} is the current consumption during power down (I_{PDN}) at that time.

2. Overcharge Detection Voltage, Overcharge Release Voltage, Overdischarge Detection Voltage, Overdischarge Release Voltage, Discharge Overcurrent Detection Voltage, Load Short Circuit Detection Voltage, Charge Overcurrent Detection Voltage, CTLC Change Voltage, CTLD Change Voltage, Load Short Circuit Detection Delay Time, CTLC Pin Response Time, CTLD Pin Response Time (Test Circuit 2)

Set S3 to OFF.

Confirm both V_{CO} and V_{DO} are in "H" (its voltage level is $V_{DS} \times 0.9$ V or more) after setting $V_1 = V_2 = V_3 = V_4 = 3.5$ V (S-8205A Series), $V_1 = V_2 = V_3 = V_4 = V_5 = 3.5$ V (S-8205B Series), $V_6 = V_7 = V_8 = 0$ V (this status is referred to as initial status 1).

2. 1 Overcharge Detection Voltage (V_{CU1}), Overcharge Release Voltage (V_{CL1})

The overcharge detection voltage (V_{CU1}) is V_1 when the V_{CO} is set to "L" (its voltage level is $V_{DS} \times 0.1$ V or less) after increasing V_1 gradually after setting $V_1 = V_2 = V_3 = V_4 = V_{CU} - 0.05$ V (S-8205A Series), $V_1 = V_2 = V_3 = V_4 = V_5 = V_{CU} - 0.05$ V (S-8205B Series) from the initial status 1. After that, decreasing V_1 gradually, V_1 is the overcharge release voltage (V_{CL1}) when the V_{CO} is set to "H" after setting $V_2 = V_3 = V_4 = 3.5$ V (S-8205A Series), $V_2 = V_3 = V_4 = V_5 = 3.5$ V (S-8205B Series).

2. 2 Overdischarge Detection Voltage (V_{DL1}), Overdischarge Release Voltage (V_{DU1})

The overdischarge detection voltage (V_{DL1}) is V_1 when the V_{DO} is set to "L" after decreasing V_1 gradually from the initial status 1. After that, increasing V_1 gradually, V_1 is the overdischarge release voltage (V_{DU1}) when V_{DO} is set to "H".

By changing V_n ($n = 2$ to 4: S-8205A Series, $n = 2$ to 5: S-8205B Series), users can define the overcharge detection voltage (V_{CU_n}), the overcharge release voltage (V_{CL_n}), the overdischarge detection voltage (V_{DL_n}), the overdischarge release voltage (V_{DU_n}) as well when $n = 1$.

2. 3 Discharge Overcurrent Detection Voltage (V_{DIOV})

The discharge overcurrent detection voltage (V_{DIOV}) is V_6 when V_{DO} is set to "L" after increasing V_6 gradually from the initial status 1.

2. 4 Load Short Circuit Detection Voltage (V_{SHORT})

The load short circuit detection voltage (V_{SHORT}) is V_6 when V_{DO} is set to "L" after increasing V_6 gradually after setting S3 to ON from the initial status 1.

2. 5 Charge Overcurrent Detection Voltage (V_{CIOV})

The charge overcurrent detection voltage (V_{CIOV}) is V_6 when V_{CO} is set to "L" after decreasing V_6 gradually from the initial status 1.

2. 6 CTLC Change Voltage (V_{CTLC})

The CTLC change voltage (V_{CTLC}) is V_7 when V_{CO} is set to "L" after increasing V_7 gradually from the initial status 1.

2. 7 CTLD Change Voltage (V_{CTLD})

The CTLD change voltage (V_{CTLD}) is V_8 when V_{DO} is set to "L" after increasing V_8 gradually from the initial status 1.

2. 8 Load Short Circuit Detection Delay Time (t_{SHORT})

Load short circuit detection delay time (t_{SHORT}) is a period in which V_{DO} changes to "L" after changing V_6 to 1.5 V instantaneously, after setting S_3 to ON from the initial status 1.

2. 9 CTLC Pin Response Time ($t_{\text{CTL C}}$)

CTL C pin response time ($t_{\text{CTL C}}$) is a period in which V_{CO} changes to "L" after changing $V_7 = V_{\text{DS}}$ instantaneously from the initial status 1.

2. 10 CTLD Pin Response Time (t_{CTLD})

CTLD pin response time (t_{CTLD}) is a period in which V_{DO} changes to "L" after changing $V_8 = V_{\text{DS}}$ instantaneously from the initial status 1.

3. CCT Pin Internal Resistance, CDT Pin Internal Resistance, CIT Pin Internal Resistance, CCT Pin Detection Voltage, CDT Pin Detection Voltage, CIT Pin Detection Voltage (Test Circuit 3)

Confirm both V_{CO} and V_{DO} are in "H" after setting $V_1 = V_2 = V_3 = V_4 = 3.5 \text{ V}$ (S-8205A Series), $V_1 = V_2 = V_3 = V_4 = V_5 = 3.5 \text{ V}$ (S-8205B Series), $V_6 = V_9 = V_{10} = V_{11} = 0 \text{ V}$ (this status is referred to as initial status 2).

3. 1 CCT Pin Internal Resistance (R_{CCT})

The CCT pin internal resistance (R_{CCT}) can be defined by $R_{\text{CCT}} = V_{\text{DS}} / I_{\text{CCT}}$ by using I_{CCT} when setting $V_1 = 4.5 \text{ V}$ from the initial status 2.

3. 2 CDT Pin Internal Resistance (R_{CDT})

The CDT pin internal resistance (R_{CDT}) can be defined by $R_{\text{CDT}} = V_{\text{DS}} / I_{\text{CDT}}$ by using I_{CDT} when setting $V_1 = 1.5 \text{ V}$ from the initial status 2.

3. 3 CIT Pin Internal Resistance (R_{CIT})

The CIT pin internal resistance (R_{CIT}) can be defined by $R_{\text{CIT}} = V_{\text{DS}} / I_{\text{CIT}}$ by using I_{CIT} when setting $V_6 = V_{\text{DIOV}} + 0.015 \text{ V}$ from the initial status 2.

3. 4 CCT Pin Detection Voltage (V_{CCT})

The CCT pin detection voltage (V_{CCT}) is V_9 when V_{CO} is set to "L" after increasing V_9 gradually, after setting $V_1 = 4.5 \text{ V}$ from the initial status 2.

3. 5 CDT Pin Detection Voltage (V_{CDT})

The CDT pin detection voltage (V_{CDT}) is V_{10} when V_{DO} is set to "L" after increasing V_{10} gradually, after setting $V_1 = 1.5 \text{ V}$ from the initial status 2.

3. 6 CIT Pin Detection Voltage (V_{CIT})

The CIT pin detection voltage (V_{CIT}) is V_{11} when V_{DO} is set to "L" after increasing V_{11} gradually, after setting $V_6 = V_{\text{DIOV}} + 0.015 \text{ V}$ from the initial status 2.

4. Charger Voltage for Start Charging 0 V Battery (Product with Function to Charge 0 V Battery) (Test Circuit 4), Battery Voltage for Inhibit Charging 0 V Battery (Product with Function to Inhibit Charging 0 V Battery) (Test Circuit 2)

4. 1 Charger Voltage for Start Charging 0 V Battery (V_{0CHA}) (Product with Function to Charge 0 V Battery)

Charger voltage for start charging 0 V battery (V_{0CHA}) is V12 when V_{CO} is 0.1 V or more after increasing V12 gradually after setting $V1 = V2 = V3 = V4 = 0$ V (S-8205A Series), $V1 = V2 = V3 = V4 = V5 = 0$ V (S-8205B Series).

4. 2 Battery Voltage for Inhibit Charging 0 V Battery (V_{0INH}) (Product with Function to Inhibit Charging 0 V Battery)

Battery voltage for inhibit charging 0 V battery (V_{0INH}) is V1 when V_{CO} is set to "L" after decreasing V1 gradually from the initial status 1.

5. CTLC Pin Internal Resistance, CTLD Pin Internal Resistance, Resistance between VM and VDD, Resistance between VM and VSS, VC1 Pin Current, VC2 Pin Current, VC3 Pin Current, VC4 Pin Current, VC5 Pin Current, CO Pin Source Current, CO Pin Leakage Current, DO Pin Source Current, DO Pin Sink Current (Test Circuit 5)

Set S1, S5, S6 and S7 to OFF, set S2 and S4 to ON.

Set $V1 = V2 = V3 = V4 = 3.5$ V (S-8205A Series), $V1 = V2 = V3 = V4 = V5 = 3.5$ V (S-8205B Series), $V6 = V13 = V14 = V15 = V16 = 0$ V (this status is referred to as initial status 3).

5. 1 CTLC Pin Internal Resistance ($R_{CTL C}$)

In the initial status 3, the value of CTLC pin internal resistance ($R_{CTL C}$) can be defined by $R_{CTL C} = V_{DS} / I_{CTL C}$ by using $I_{CTL C}$.

5. 2 CTLD Pin Internal Resistance ($R_{CTL D}$)

In the initial status 3, the value of CTLD pin internal resistance ($R_{CTL D}$) can be defined by $R_{CTL D} = V_{DS} / I_{CTL D}$ by using $I_{CTL D}$.

5. 3 Resistance between VM and VDD (R_{VMD}) (For products with power-down function)

The value of resistance between VM and VDD (R_{VMD}) can be defined by $R_{VMD} = V_{DS} / I_{VM}$ by using I_{VM} when setting $V1 = V2 = V3 = V4 = 1.8$ V (S-8205A Series), $V1 = V2 = V3 = V4 = V5 = 1.8$ V (S-8205B Series) from the initial status 3.

5. 4 Resistance between VM and VSS (R_{VMS})

The value of resistance between VM and VSS (R_{VMS}) can be defined by $R_{VMS} = V_{DS} / I_{VM}$ by using I_{VM} when setting $V6 = 1.5$ V, S2 to OFF, S1 to ON from the initial status 3.

5. 5 VC1 Pin Current (I_{VC1}), VC2 Pin Current (I_{VC2}), VC3 Pin Current (I_{VC3}), VC4 Pin Current (I_{VC4}), VC5 Pin Current (I_{VC5})

In the initial status 3, I_1 is the VC1 pin current (I_{VC1}), I_2 is the VC2 pin current (I_{VC2}), I_3 is the VC3 pin current (I_{VC3}), I_4 is the VC4 pin current (I_{VC4}), I_5 is the VC5 pin current (I_{VC5}).

5. 6 CO Pin Source Current (I_{COH}), CO Pin Leakage Current (I_{COL})

The CO pin source current (I_{COH}) is I_{CO} when setting $V13 = 0.5$ V from the initial status 3. After that, the CO pin leakage current (I_{COL}) is I_{CO} when setting $V1 = V2 = V3 = V4 = 6$ V (S-8205A Series), $V1 = V2 = V3 = V4 = V5 = 4.8$ V (S-8205B Series), S4 to OFF, S5 to ON.

5. 7 DO Pin Source Current (I_{DOH}), DO Pin Sink Current (I_{DOL})

The DO pin source current (I_{DOH}) is I_{DO} when setting $V14 = 0.5$ V, S6 to ON from the initial status 3. After that, the DO pin leakage current (I_{DOL}) is I_{DO} when setting $V1 = V2 = V3 = V4 = 1.8$ V (S-8205A Series), $V1 = V2 = V3 = V4 = V5 = 1.8$ V (S-8205B Series), S6 to OFF, S7 to ON, $V15 = 0.5$ V.

BATTERY PROTECTION IC FOR 4-SERIES OR 5-SERIES CELL PACK

S-8205A/B Series

Figure 6 Test Circuit 2

Figure 7 Test Circuit 3

Figure 8 Test Circuit 4

Figure 9 Test Circuit 5

■ Operation

Remark Refer to "■ Connection Examples of Battery Protection IC".

1. Normal Status

In the S-8205A/B Series, both of CO and DO pins get the V_{DD} level when all values of battery voltage are in the range of overdischarge detection voltage (V_{DLn}) to overcharge detection voltage (V_{CUn}), and due to the discharge current, the VINI pin's voltage is in the range of charge overcurrent detection voltage (V_{CIOV}) to discharge overcurrent detection voltage (V_{DIOV}). This is the normal status. At this time, the charge and discharge FETs are on.

2. Overcharge Status

In the S-8205A/B Series, any voltage of the batteries increases to the level of V_{CUn} or more, the CO pin is set in high impedance. This is the overcharge status. The CO pin is pulled down to EB- by an external resistor so that the charge FET is turned off and it stops charging.

This overcharge status is released if either condition 1 or 2 is satisfied;

- (1) In case that the CO pin voltage is $1 / 50 \times V_{DS}$ or less, and all voltages of the batteries which are V_{CUn} or more are in the level of overcharge release voltage (V_{CLn}) or less.
- (2) In case that the VMP pin voltage is $1 / 50 \times V_{DS}$ or more, and all voltages of the batteries are in the level of V_{CUn} or less.

3. Overdischarge Status

In the S-8205A/B Series, when any voltage of the batteries decreases to the level of V_{DLn} or less, the DO pin voltage gets the V_{SS} level. This is the overdischarge status. The discharge FET is turned off and it stops discharging.

This overcharge status is released if either condition 1 or 2 is satisfied;

- (1) In case that the VM pin voltage is in the V_{SS} level or less, and all voltages of the batteries are in the V_{DLn} level or more.
- (2) In case that the VM pin voltage is $V_{DS} / 5$ (typ.) or less and the VM pin voltage is in the V_{SS} level or more, and all voltages of the batteries which are V_{DLn} or less are in the level of overdischarge release voltage (V_{DUn}) or more.

4. Power-down Status (For products with power-down function)

In the S-8205A/B Series, when it reaches the overdischarge status, the VM pin is pulled up to the V_{DD} level by a resistor between VM and VDD pin (R_{VMD}). If the VM pin voltage and the CO pin voltage increase to the level of $V_{DS} / 5$ (typ.) or more, almost every circuit in the S-8205A/B stops working so that the current consumption decreases to the level of current consumption during power down (I_{PDN}) or less. This is the power-down status.

The power-down status is released if the following condition is satisfied.

- (1) The VM pin voltage gets $V_{DS} / 5$ (typ.) or less.
- (2) The CO pin voltage gets $V_{DS} / 5$ (typ.) or less.

5. Discharge Overcurrent Status

The discharging current increases more than a certain value. As a result, if the status in which the VINI pin voltage increases to the level of V_{DIOV} or more, the DO pin gets the V_{SS} level. This is the discharge overcurrent status. The discharge control FET is turned off and it stops discharging. In the status of discharge overcurrent, the CO pin is set in high impedance. The VM pin is pulled down to the V_{SS} level by a resistor between VM and VSS pin (R_{VMS}).

S-8205A/B Series has two levels for discharge overcurrent detection (V_{DIOV} , V_{SHORT}).

The S-8205A/B Series' actions against load short circuit detection voltage (V_{SHORT}) are as well in V_{DIOV} .

The discharge overcurrent status is released if the following condition is satisfied.

- (1) The VM pin voltage gets $V_{DS} / 10$ (typ.) or less.

6. Charge Overcurrent Status

In the S-8205A/B Series, the charge current increases more than a certain value. As a result, if the status in which the VINI pin voltage decreases to the level of V_{CIOV} or less, the CO pin is set in high impedance. This is the charge overcurrent status. The charge control FET is turned off and it stops charging. In this charge overcurrent status, DO pin gets the V_{SS} level. The VM pin is pulled-up to the V_{DD} level by resistance between VM and VDD (R_{VMD}).

The status of charge overcurrent is released if the following condition is satisfied.

- (1) The CO pin voltage gets $1 / 50 \times V_{DS}$ (typ.) or more.

7. 0 V Battery Charge Function

In the S-8205A/B Series, regarding how to charge a discharged battery (0 V battery), users are able to select either function of the two mentioned below.

- (1) Enable to charge a 0 V battery
A 0 V battery is charged when charger voltage is more than voltage for start charging 0 V battery (V_{0CHA}).
- (2) Inhibit charging a 0 V battery
A 0 V battery is not charged when any battery voltage is battery voltage for inhibit charging 0 V battery (V_{0INH}) or less.

Caution When the VDD pin voltage is less than the minimum value of operation voltage between VDD and VSS pin (V_{DSOP}), the S-8205A/B Series' action is not assured.

8. Delay Time Setting

In the S-8205A/B Series, users are able to set delay time for the period; from detecting any voltage of the batteries or detecting changes in the voltage at the VINI pin, to the output to the CO, DO pin. Each delay time is determined by a resistor in the IC and an external capacitor.

In the overcharge detection, when any voltage of the batteries gets V_{CUH} or more, the S-8205A/B starts charging to the CCT pin's capacitor (C_{CCT}) via the CCT pin's internal resistor (R_{CCT}). After a certain period, the CO pin is set in high impedance if the voltage at the CCT pin reaches the CCT pin detection voltage (V_{CCT}). This period is overcharge detection delay time (t_{CU}).

t_{CU} is calculated using the following equation ($V_{DS} = V1 + V2 + V3 + V4 + V5$).

$$\begin{aligned} t_{CU} [s] &= -\ln (1 - V_{CCT} / V_{DS}) \times C_{CCT} [\mu F] \times R_{CCT} [M\Omega] \\ &= -\ln (1 - 0.7 \text{ (typ.)}) \times C_{CCT} [\mu F] \times 8.31 [M\Omega] \text{ (typ.)} \\ &= 10.0 [M\Omega] \text{ (typ.)} \times C_{CCT} [\mu F] \end{aligned}$$

Overdischarge detection delay time (t_{DL}), discharge overcurrent detection delay time (t_{DIOV}), charge overcurrent detection delay time (t_{CIOV}) are calculated using the following equations as well.

$$\begin{aligned} t_{DL} [ms] &= -\ln (1 - V_{CDT} / V_{DS}) \times C_{CDT} [\mu F] \times R_{CDT} [k\Omega] \\ t_{DIOV} [ms] &= -\ln (1 - V_{CIT} / V_{DS}) \times C_{CIT} [\mu F] \times R_{CIT} [k\Omega] \\ t_{CIOV} [ms] &= -\ln (1 - V_{CIT} / V_{DS}) \times C_{CIT} [\mu F] \times R_{CIT} [k\Omega] \end{aligned}$$

In case $C_{CCT} = C_{CDT} = C_{CIT} = 0.1 [\mu F]$, each delay time t_{CU} , t_{DL} , t_{DIOV} , t_{CIOV} is calculated as follows.

$$\begin{aligned} t_{CU} [s] &= 10.0 [M\Omega] \text{ (typ.)} \times 0.1 [\mu F] = 1.0 [s] \text{ (typ.)} \\ t_{DL} [ms] &= 1000 [k\Omega] \text{ (typ.)} \times 0.1 [\mu F] = 100 [ms] \text{ (typ.)} \\ t_{DIOV} [ms] &= 200 [k\Omega] \text{ (typ.)} \times 0.1 [\mu F] = 20 [ms] \text{ (typ.)} \\ t_{CIOV} [ms] &= 200 [k\Omega] \text{ (typ.)} \times 0.1 [\mu F] = 20 [ms] \text{ (typ.)} \end{aligned}$$

Load short circuit detection delay time (t_{SHORT}) is fixed internally.

9. CTLC and CTLD Pins

The S-8205A/B Series has two pins to control.

The CTLC pin controls the CO pin, the CTLD pin controls the DO pin. Thus it is possible for users to control the CO pin and DO pin independently. These controls precede the battery protection circuit.

Table 7 Conditions Set by CTLC Pin

CTLC Pin	CO Pin
CTLC pin voltage $\geq V_{CTLC}$	High-Z
Open ^{*1}	High-Z
CTLC pin voltage $< V_{CTLC}$	Normal status ^{*2}

*1. Pulled up by R_{CTLC} when CTLC pin is open

*2. The status is controlled by the voltage detection circuit.

Table 8 Conditions Set by CTLD Pin

CTLD Pin	DO Pin
CTLD pin voltage $\geq V_{CTLD}$	V_{SS} level
Open ^{*1}	V_{SS} level
CTLD pin voltage $< V_{CTLD}$	Normal status ^{*2}

*1. Pulled up by R_{CTLD} when CTLD pin is open

*2. The status is controlled by the voltage detection circuit.

■ Timing Chart

Table 9 Constants for External Components

Symbol	Typical	Range	Unit
R _{VC1}	1	0.47 to 1 ^{*1}	kΩ
R _{VC2}	1	0.47 to 1 ^{*1}	kΩ
R _{VC3}	1	0.47 to 1 ^{*1}	kΩ
R _{VC4}	1	0.47 to 1 ^{*1}	kΩ
R _{VC5}	1	0.47 to 1 ^{*1}	kΩ
R _{DO}	5.1	1 to 10	kΩ
R _{CO}	1	0.1 to 1	MΩ
R _{VM}	5.1	3 to 10	kΩ
R _{CTL}	1	0.1 to 1	kΩ
R _{CTLD}	1	0.1 to 1	kΩ
R _{VINI}	1	0.1 to 1	kΩ
R _{SENSE}	—	0 or higher	mΩ
R _{VDD}	100	43 to 100 ^{*1}	Ω
C _{VC1}	0.1	0.068 to 1 ^{*1}	μF
C _{VC2}	0.1	0.068 to 1 ^{*1}	μF
C _{VC3}	0.1	0.068 to 1 ^{*1}	μF
C _{VC4}	0.1	0.068 to 1 ^{*1}	μF
C _{VC5}	0.1	0.068 to 1 ^{*1}	μF
C _{CCT}	0.1	0.01 or higher	μF
C _{CDT}	0.1	0.01 or higher	μF
C _{CIT}	0.1	0.02 or higher	μF
C _{VDD}	1	0 to 10 ^{*1}	μF

*1. Set up a filter constant to be $R_{VDD} \times C_{VDD} = 68 \mu\text{F} \cdot \Omega$ or more, and to be $R_{VC1} \times C_{VC1} = R_{VC2} \times C_{VC2} = R_{VC3} \times C_{VC3} = R_{VC4} \times C_{VC4} = R_{VC5} \times C_{VC5} = R_{VDD} \times C_{VDD}$.

Caution 1. The above constants may be changed without notice.

2. It is recommended that filter constants between VDD and VSS should be set approximately to $100 \mu\text{F} \cdot \Omega$.
e.g., $C_{VDD} \times R_{VDD} = 1.0 \mu\text{F} \times 100 \Omega = 100 \mu\text{F} \cdot \Omega$

Sufficient evaluation of transient power supply fluctuation and overcurrent protection function with the actual application is needed to determine the proper constants. Contact our sales office in case the constants should be set to other than $100 \mu\text{F} \cdot \Omega$.

3. It has not been confirmed whether the operation is normal or not in circuits other than the above example of connection. In addition, the example of connection shown above and the constant do not guarantee proper operation. Perform thorough evaluation using the actual application to set the constant.

■ Precautions

- The application conditions for the input voltage, output voltage, and load current should not exceed the package power dissipation.
- Batteries can be connected in any order, however, there may be cases when discharging cannot be performed when a battery is connected. In this case, short the VM pin and VSS pin or connect the battery charger to return to the normal mode.
- If both an overcharge battery and an overdischarge battery are included among the whole batteries, the condition is set in overcharge status and overdischarge status. Therefore either charging or discharging is impossible.
- Do not apply an electrostatic discharge to this IC that exceeds the performance ratings of the built-in electrostatic protection circuit.
- SII claims no responsibility for any disputes arising out of or in connection with any infringement by products including this IC of patents owned by a third party.
